

# NASA, Engineering, and Swarming Robots

Kurt Leucht  
NASA Software Engineer  
Kennedy Space Center, FL

- Kurt Leucht (Loyt)
  - husband and father of 2 boys
  - NASA software engineer
  - 24 years with NASA
  - loves computers and software
  - designs and creates command and control software for robotic systems and for launch pad systems
  - also designs and creates advisory systems and development and productivity tools to increase efficiency and productivity of NASA workers

- What is NASA's purpose or vision?

National Aeronautics and Space Administration

REACH  
—NEW—  
HEIGHTS

BENEFIT  
—ALL—  
HUMANKIND

REVEAL  
—THE—  
UNKNOWN

- To meet NASA's vision, thousands of people have been working around the world, and off of it, for more than 50 years, trying to answer some basic questions:

- What's out there in space?
- How do we get there?
- What will we find?
- What can we learn there, or learn just by trying to get there, that will make life better here on Earth?

STAND BACK

I'M GOING TO TRY  
SCIENCE

# Science vs. Engineering

- What's the difference between Science and Engineering?
  - science is the study and understanding of the physical world and all it contains
  - engineering applies that scientific knowledge to solve problems and to make new things
- In other words...
  - science is about knowledge and engineering is about invention

# Scientist vs. Engineer

- It's not a contest! Both are needed in the world!

- Both scientists and engineers need a strong knowledge of science, math and technology.

# NASA Engineer

- Since I'm a NASA Engineer, I solve problems for NASA and I also invent new things for NASA.

- Can you think of some unique problems that NASA might have?

past

present

future

- Why were robots invented?
- The three D's:
  - to do work and tasks that are **Dull, Difficult** or **Dangerous**

- Why do we sometimes copy animals and people when we invent robots?

- Sometimes the best way to do a task has already been perfected by nature, I guess.

# Ant Colonies

20 million ants per colony: No foreman, no blueprints, no one in charge

- How do such tiny ants with such tiny brains accomplish so much?
  - build a complex nest that supports the colony
  - find and gather food and water ... enough to support the entire nest

# Wait. What?

- Did you say that ants are good at these things even with tiny brains?

- build a complex nest that supports the colony

- find and gather food and water ... enough to support the entire nest

- 
- 
- 
- 
- 
- Might NASA need robots that can do these types of things?

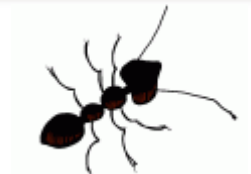

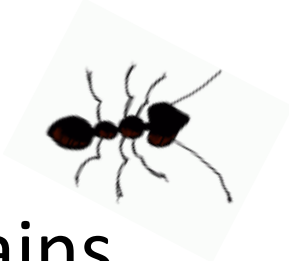

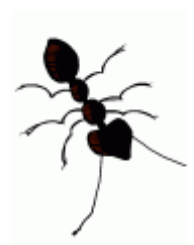

- build a complex nest that supports the colony

- find and gather food and water ... enough to support the entire nest

- 
- 
- 
- 
- 
- How do such tiny ants with such tiny brains accomplish so much?

- build a complex nest that supports the colony

- find and gather food and water ... enough to support the entire nest

- Scientists have studied ants and have taken note of how they behave when searching for food and bringing that food home to the nest.

- Scientists and engineers have programmed the ant behaviors into a computer simulation.

- This verifies that they have properly captured the ant behaviors and that those behaviors work in simulation the same way they work in real ants.

- NASA has programmed the same ant behaviors into a group of small robots.
- **Meet the NASA Swarmies!**

# Robot Platform

The Swarmie robot platform is a low-cost, ground-based research and demonstration platform.

- Locomotion:
  - 4-wheel skid-steer design
  - both motors on each side of the robot are commanded simultaneously by the software
- Obstacle detection:
  - 3 sets of ultrasonic sensors
  - detect solid obstacles in front of the robot
- Localization:
  - global positioning system (GPS) sensor for location
  - inertial measurement unit (IMU) sensor for compass-based heading
- Resource detection:
  - USB web camera
  - AprilTags Visual Fiducial System software library (bar codes)
  - printed AprilTags arranged on the ground

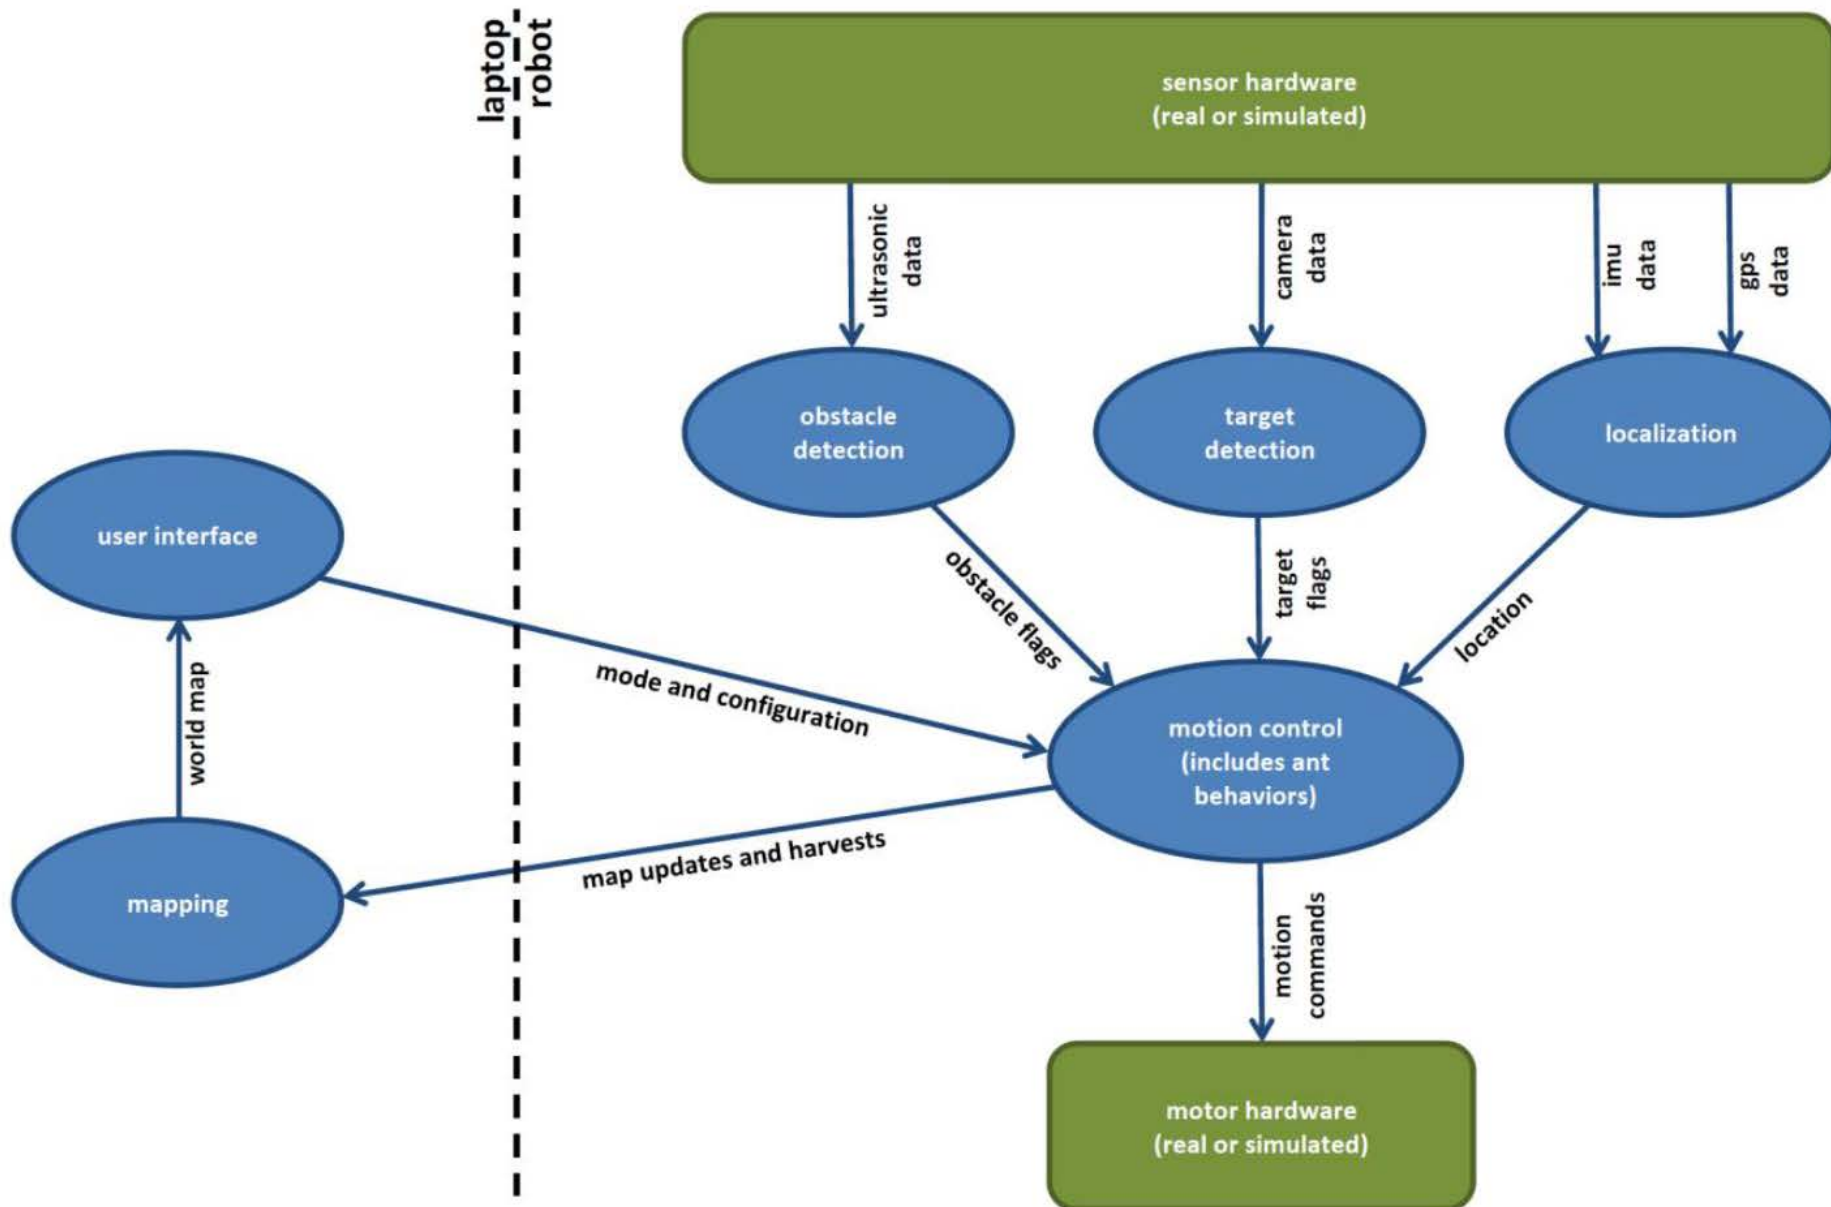

2 onboard computers with USB serial connection between them:

- Arduino compatible micro-controller stack:
  - chipKIT Max32 board, Arduino Mega Prototype board
  - data acquisition for GPS, IMU, ultrasonic sensors
  - motor control
- Linux compatible single board computer (SBC):
  - BeagleBoard-xM board
  - image acquisition for USB camera
  - all onboard computation
  - all behavioral programming

- Wheel motors and batteries are housed inside the enclosed chassis.
- Micro-controller stack, SBC, and GPS and ultrasonic sensors are mounted on top of the enclosed chassis.
- USB web camera is mounted on top of the robot's protective lid to get a better angle on the printed AprilTags that are placed flat on the ground.
- IMU sensor is mounted on top next to USB web camera to distance that sensitive magnetic field sensor from electromagnetic noise emitted from wheel motors.

Installed on BeagleBoard-xM SBC:

- Ubuntu Linux operating system
- Open source Robot Operating System (ROS) framework
  - tools, libraries, data types, conventions
  - simplifies task of creating robot behavior in software

 ROS

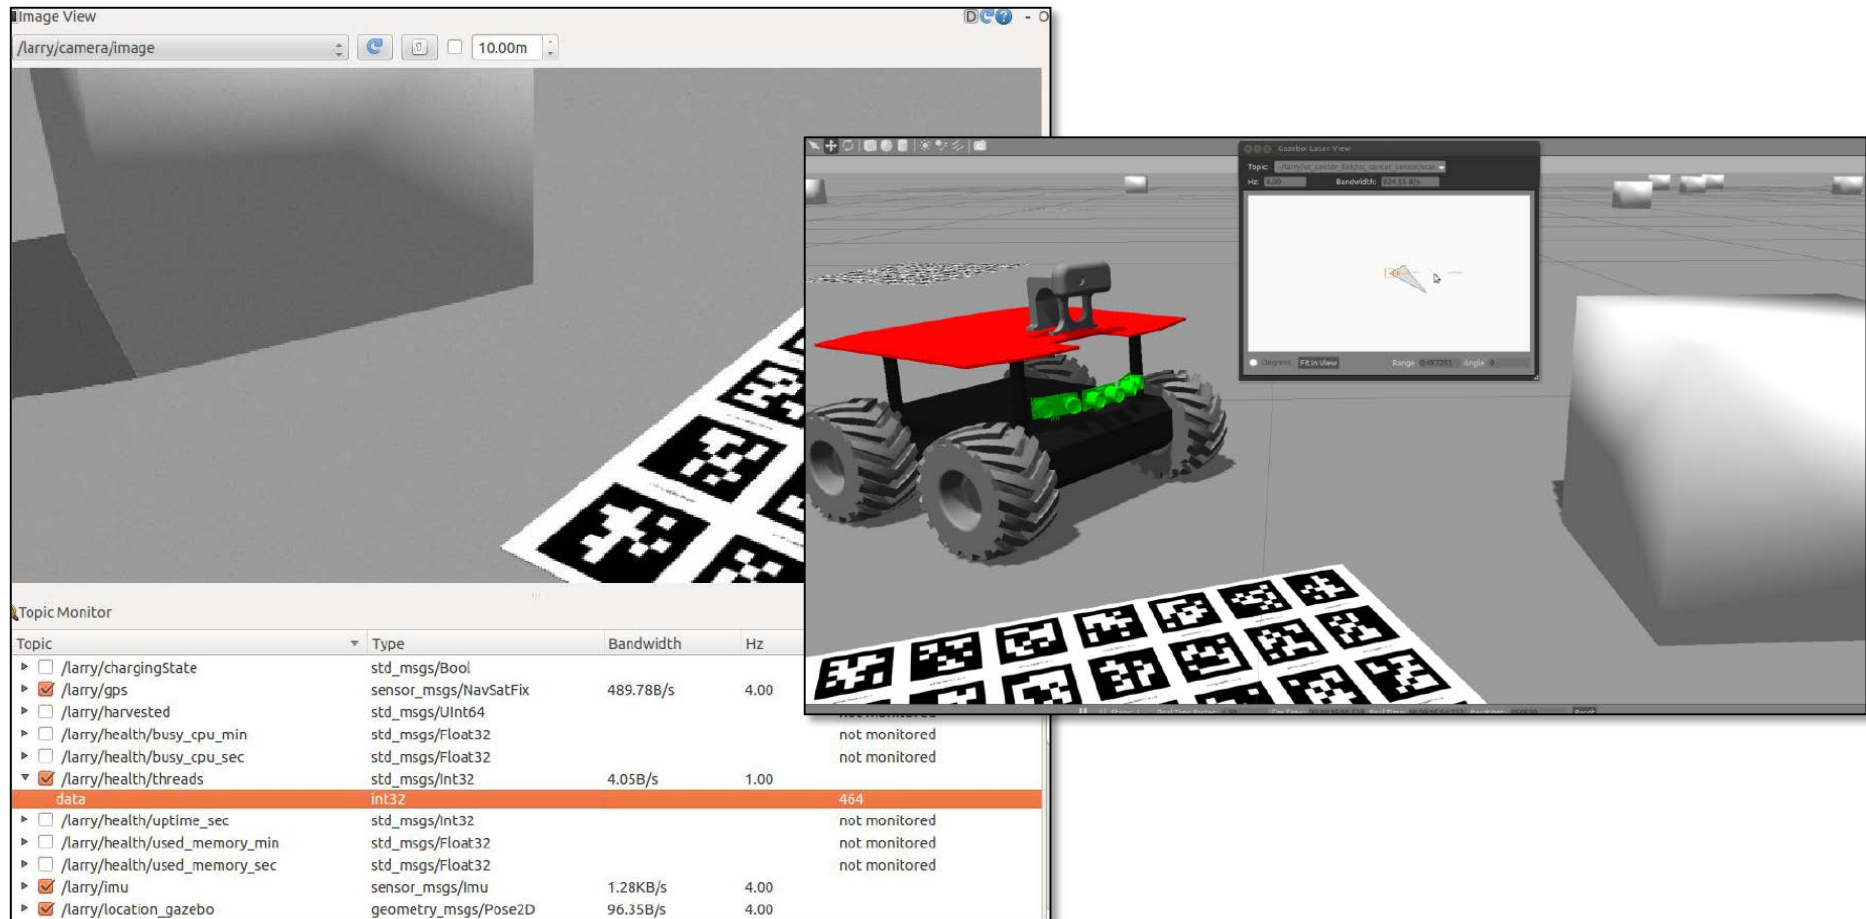

The ROS logo icon, which is a blue square containing four white dots arranged in a 2x2 grid.

 Open Source Robotics Foundation

The logo icon for the Open Source Robotics Foundation, which is a blue hexagon with a white circle inside.

Two open source software systems were heavily utilized by the project and were critical to its success:

- Robot Operating System (ROS) and associated packages
- Gazebo robot simulator and associated plugins

The screenshot displays the ROS Gazebo simulation environment. On the left, a camera view window shows a first-person perspective of the robot. In the center, a 3D model of a four-wheeled robot with a red top and green sensors is visible. On the right, a Gazebo Laser View window shows a 2D plot of laser range-finding data. At the bottom, a Topic Monitor window lists various ROS topics and their bandwidths.

Topic	Type	Bandwidth	Hz
<input type="checkbox"/> /larry/chargingState	std_msgs/Bool		
<input checked="" type="checkbox"/> /larry/gps	sensor_msgs/NavSatFix	489.78B/s	4.00
<input type="checkbox"/> /larry/harvested	std_msgs/UInt64		
<input type="checkbox"/> /larry/health/busy_cpu_min	std_msgs/Float32		
<input type="checkbox"/> /larry/health/busy_cpu_sec	std_msgs/Float32		
<input checked="" type="checkbox"/> /larry/health/threads	std_msgs/int32	4.05B/s	1.00
data	int32		464
<input type="checkbox"/> /larry/health/uptime_sec	std_msgs/int32		not monitored
<input type="checkbox"/> /larry/health/used_memory_min	std_msgs/Float32		not monitored
<input type="checkbox"/> /larry/health/used_memory_sec	std_msgs/Float32		not monitored
<input checked="" type="checkbox"/> /larry/imu	sensor_msgs/Imu	1.28KB/s	4.00
<input checked="" type="checkbox"/> /larry/location_gazebo	geometry_msgs/Pose2D	96.35B/s	4.00

19 Gazebo simulation trials were performed:

- 2 hour trials
- 4 simulated Swarmie robots
- 256 resource tags arranged in 4 tight clusters of 64
- 50 obstacles
- arena size of 400 square meters

10 real Swarmie robot trials were performed:

- 2 hour trials
- 4 real Swarmie robots
- 256 resource tags arranged in 4 tight clusters of 64
- 0 obstacles
- arena size of 400 square meters

17 additional long term Gazebo simulation trials were performed:

- 12 hour trials
- 4 simulated Swarmie robots
- 256 resource tags arranged in 4 tight clusters of 64
- 50 obstacles
- arena size of 400 square meters

## The robots worked!

- They found and gathered simulated food from an unknown area that was filled with obstacles.
- They used simulated pheromone trails to communicate with others.
- They simulated robot battery charging which could be necessary for future Mars missions.
- They worked together to increase the efficiency of the colony.
- They accomplished all this using inexpensive computers and inexpensive sensors.

# Take Away

Biologically inspired cooperative robots are a promising new research area and could provide great benefits to future space exploration missions.

# Another Take Away

---

Students just like you will someday perform research and solve technical problems that will help humans live and work on Mars.
